

QM46 control panel display going out

Under certain circumstances the press will suddenly stop and the display on the control panel will turn off. The delivery light is still on but not the display. Sometimes just turning the main power off then on again will bring the display back on. This can be frustrating because in some instances the press loses its memory that there are plates on the cylinders. So you take them off, re-install them just to have the display go out again. This is usually caused by a voltage drop due to a weak pin/plug connection. This issue should be addressed as soon as possible. The weak connection will damage pins on boards over time and could cause expensive service calls to replace circuit boards.

I have the upgraded plugs and connectors already installed on the wire harness. All you need to do is call, order the MOD, install it yourself and return your old harness. The installation of the harness takes about 30 min. This repair is intended for the QM46 model Ser# 955001 to 960331 and should have SVK2 /05 **not the PM46 model ser#960332 and up**. Kits are only \$59.00 - \$99.00 + tax and shipping when applicable. Please call for additional information or to order your kit.

Thank you in advance,

Stan Welton
